The role of legumes in achieving sustainable agriculture

Sonya Kalakonda MSc, PhD Student in Sustainable Agriculture

The challenge: Sustainable Food Production

CREATING A SUSTAINABLE FOOD FUTURE BY 2050

How to Sustainably Feed 10 Billion People by 2050, in 21 Charts (2018) World Resources Institute.

Increase global food production significantly

Prevent further spread of agriculture into natural or semi natural habitat

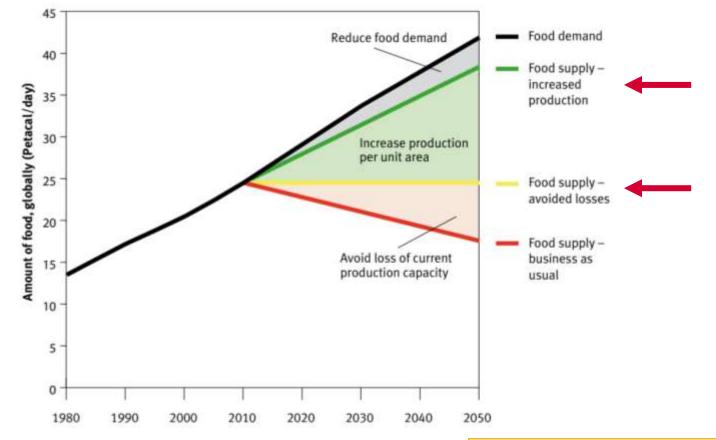

Decrease negative environmental issues associated with agriculture

Routes to achieve future food security

Figure 2: Balancing food supply and demand.

A brief introduction to legumes

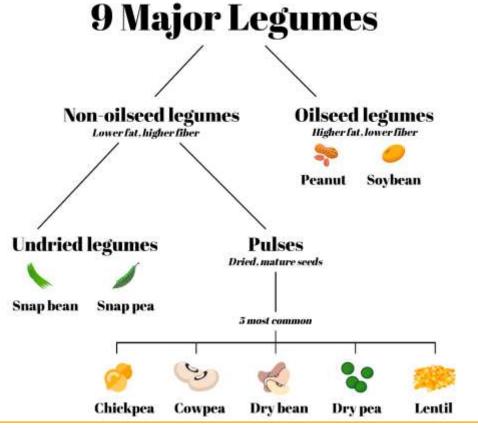

Figure: **Defining Nutritional and Functional Niches of Legumes: A Call for Clarity to Distinguish a Future Role for Pulses in the Dietary Guidelines for Americans** (2021) https://doi.org/10.3390/nu13041100

- Archaeological signs of widespread legume cultivation across Asia, Africa, the Americas and Europe. some dating as far back at 7,000 years BC.
- Leguminosae family: ~ 800 genera, ~20,000 species. Capable of fixing N
- Grain legumes: used for human food and animal feed (soy/pea).
- Forage legumes: Animal feed e.g. alfalfa and clover

Legumes as a Cornerstone of the Transition Toward More Sustainable Agri-Food Systems and Diets in Europe. (2021) doi: 10.3389/fsufs.2021.694121

∍xtraordinar∨ futures await

Legume nutrition

- Nutrient dense food for achieving food security. Contain macro (protein, carbohydrates, fat) and micro nutrients (Fe, Zn, K, thiamine, folate, Vit E, Vit A etc) and fibre.
- A recent review stated there is no strong evidence to suggest that "anti-nutrients" present in legumes cause deleterious effects to human health when consumed in their whole form, after proper preparation.
- The benefits of eating legumes far outweigh any potential impacts of certain compounds. In some cases, so – called 'anti-nutrients- may be therapeutic.

Defining Nutritional and Functional Niches of Legumes: A Call for Clarity to Distinguish a Future Role for Pulses in the Dietary Guidelines for Americans (2021) https://doi.org/10.3390/nu13041100 Is There Such a Thing as "Anti-Nutrients"? A Narrative Review of Perceived Problematic Plant Compounds (2020) doi: 10.3390/nu12102929

Figure 1: Illustration of intercropping systems and strategies. Panels (a – d) show different planting designs for intercropping (a = strip, b = relay, c = row and d = mixed). Figure from Li et al. (2020)

Cereal-legume cropping systems for enhanced productivity, food security, and resilience (2022) doi:10.1079/9781800621602.0003, (33-47)

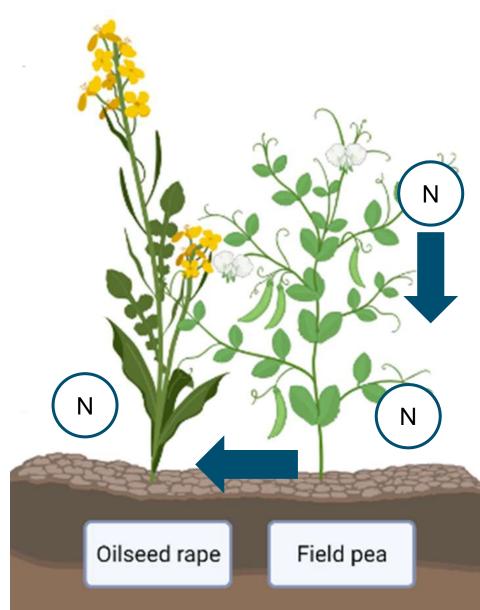

Increased Production: Intercropping with Legumes

Benefits:

- 1) Complementary N acquisition strategies reducing N inputs
- 2) Improved soil N content after legume crop
- 3) Transfer of N from legume to companion

Intercropping of grain legumes and cereals improves the use of soil N resources and reduces the requirement for synthetic fertilizer N: A global-scale analysis (2020) https://doi.org/10.1007/s13593-020-0607-x

Yield and fertilizer benefits of maize/grain legume intercropping in China and Africa: A meta-analysis (2022). https://doi.org/10.1007/s13593-022-00816-1

Reduce Losses/Inefficiencies: Legumes for plant-based protein

The world can produce 14 times more protein on the same area of land by simply switching from meat to plant alternatives

A mix of beans, peas, oats and soybeans satisfies the protein needs of 28% of the world's population in 2030

Beef satisfies the protein needs of 2% of the world's population in 2030

madre brava

 Animal based proteins e.g. beef, are relatively inefficient protein sources

 Huge amount of crops fed to livestock (e.g. soyabean) which could be fed directly to humans (including legumes).

Madre Brava (2023) — Replacing 30% of meat with plants proteins could offset almost all global aviation emissions, free up an India-sized carbon sink and save 7.5 million swimming pools worth of water a year
